

ALATPAY BUILDATHON

Payments you can take **back.**

Africa's trust-first digital banking platform — built so a mistake or a scam doesn't have to be final.

RETON PTE LTD · Live at retonpay.com · Licensed rails via ALAT by Wema

THE PROBLEM

Sending money is easy. Taking it back is not.

- One wrong digit and the money is gone.
- Scams move faster than bank disputes.
- Most wallets optimise for “send and forget.”
- People don’t need another clone — they need a second chance.

THE INSIGHT

Trust isn't a badge on the login screen. It's what happens **after** the money moves.

Reton is built for the moment something goes wrong — not just the moment you hit send.

The first wallet with an undo button for money.

The screenshot shows the Reton website's hero section. At the top is a navigation bar with the Reton logo, links for Business (marked SOON), How it works, Security, and FAQ, and buttons for Sign in and Get started. Below the navigation bar is a tagline 'Trust-first banking for Africa'. The main headline reads 'The first wallet with an undo button for money.' followed by a sub-headline explaining the 'callback protection' feature. Two primary action buttons are present: 'Open a free wallet' and 'See how it works'. A secondary button 'For business' is also shown, with a 'SOON' indicator. Three key features are highlighted in separate boxes: '100% ledger-backed', '<50ms fraud checks', and '72h callback window'. At the bottom, a settlement partner logo for ALAT by Wema is displayed. On the right side of the hero section, there is a mockup of the Reton wallet interface. This mockup shows a 'PROTECTED BALANCE' of ₦ 248,500.00, a transaction history with a 'To Ada' transaction (protected, held, -₦ 40,000), and a 'Callback raised' notification indicating that ₦40,000 is on its way back.

FLAGSHIP

Callback Protection

Hold a payment until you're ready. Release it when it feels right — or pull it back if something's off.

- Receiver sees “Payment Protected.”
- Every step is logged on a visible timeline.
- Sender, receiver, and admin can act with clarity.

HOW IT WORKS

Clear flows. Safer money.

HOW IT WORKS

Clear flows. Safer money.

Reton protects transfers before they finalize, helps recover mistakes, and watches every payment for fraud — so speed never costs you your money.

Callback protection

1

Pick Protected when you send. The money moves into escrow, not to the recipient.

2

They see a pending payment. You can release it — or raise a callback to recall it.

3

If you recall, they accept (you're refunded) or reject (a Reton agent reviews and decides).

Wrong-transfer recovery

1

Sent a normal transfer to the wrong account? Report it from the Protection tab.

2

If eligible, we freeze that amount in the recipient's wallet and notify them.

3

They return it, or dispute — and if they go quiet, it escalates for review.

Callback Protection and wrong-transfer recovery — explained in three steps each, built for real people.

WHAT WE BUILT

A full trust stack — not slideware.

Wrong-transfer recovery

Report a mistake. Eligible funds can be held while we open and track a case.

Fraud signals

Rule-based scoring — velocity, size, device risk — with admin visibility.

Double-entry wallet

Every naira is ledgered. No silent balance tweaks.

KYC tiers

CBN-aligned limits. BVN unlock for funding.

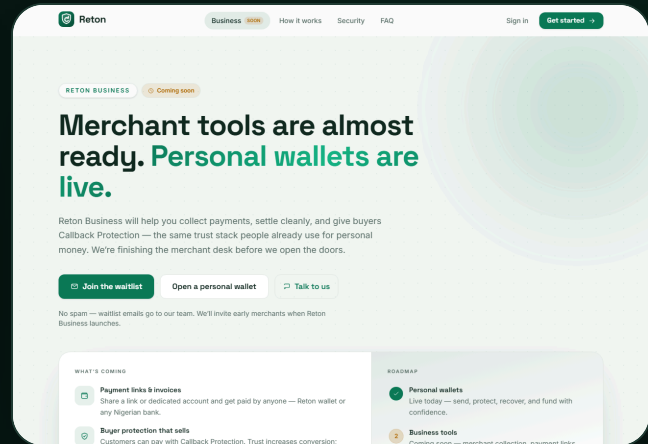

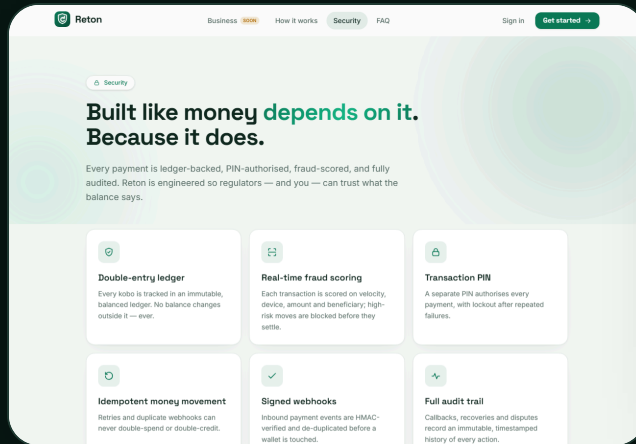

Protected marketplace

Sell digital goods with protection until delivery is confirmed.

Money-aware support

Find a transaction, explain protection, escalate when needed.

Security posture. Business on the way.

Left: engineered for regulators, not just users. Right: Reton Business waitlisted — personal wallets ship first.

ALATPAY INTEGRATION

Real rails. Not a mock bank.

What we use

Collections & payment links · Static virtual accounts · BVN OTP provisioning · Signed webhooks · Transaction verification

Where money enters

Users fund Reton wallets on ALATPay. We credit a double-entry ledger only after verified settlement.

ALAT by Wema gives us a licensed Nigerian bank rail — so Callback Protection sits on infrastructure people can trust.

PRODUCT · LIVE

Reachable. Self-explanatory.

FAQ

Questions, answered.

Everything you need to know about keeping your money safe with Reton.

What makes Reton different from other wallets?

>

How does a protected transfer work?

>

Is my money safe? Who holds it?

>

How do I fund my wallet?

>

What can I pay for?

>

What about Reton Business?

>

What is the transaction Pkts for?

>

Does Reton charge fees?

>

Real support channels and plain-language answers — trust isn't only in the ledger.

WHY RETON

We're not another wallet.

- **Trust layer** — protection and recovery are the product, not a FAQ.
- **Visible timeline** — every money event is explainable.
- **Licensed settlement** — ALATPay / Wema, not a closed IOU ledger.
- **Production mindset** — webhooks signed, PINs required, secrets encrypted, admin audited.

BUILT TO SHIP

Serious stack. Serious money.

Laravel 12

Domain-driven backend. Controllers stay thin. Payments are atomic.

Inertia + React

Fast, modern product UI — dark/light, mobile-first.

Postgres • Redis • Horizon

Queues, realtime trust updates, ops that survive a live demo.

DEMO IN 90 SECONDS

Show, don't tell.

1 · Open a wallet — see balance & KYC tier

2 · Send a protected transfer

3 · Receiver sees Payment Protected

4 · Request callback — timeline updates live

5 · Optional: recovery case or admin fraud view

The story: money moved — and I still had control.
